

e-Medsys EHR and e-Prescribing: Now *THIS* is Great!

There are many features *built into* our e-Medsys EHR. One of them is Prescription Management which includes e-Prescribing.

e-Medsys EHR Prescription Management includes the ability to quickly select from a “favorites” list. When a selection is made, the system immediately produces warnings on dosages, interactions, and allergies. If any of these warnings are produced, the provider can then make an alternative selection.

e-Medsys EHR Prescription Manager also displays formularies based on the patient’s insurance coverage, making it easy to select medications that will be covered.

As the medication is selected, the system records it on the patient’s e-Medsys EHR record for future use, making it incredibly easy to issue refills.

e-Prescribing: Once the provider has selected the medication(s) and dosage(s), the patient’s pharmacy is selected from the pharmacy list. The provider taps the “e-Send” link and the prescription information is transmitted electronically from e-Medsys EHR directly to the pharmacy’s system via SuresScripts™ *in true electronic format* adhering to CMS-approved protocols for electronic prescribing.

The importance of true electronic prescribing is that your transmission does not “hit” the pharmacy as a fax or an auto-fax (as is the case with so many other EHRs). e-Medsys EHR issues a true electronic transmission, from system to system, resulting in a safer and more efficient prescription process.

Further, according to CMS information, practices that e-Prescribe in a CMS-approved format will begin to receive ***increased reimbursements starting in 2009, making electronic prescribing with e-Medsys EHR even more significant.***

And since e-Medsys EHR Version 5.0 is **2007 CCHIT CertifiedSM**, you are assured that all transmissions also adhere to HIPAA guidelines for security and privacy.

The obvious benefits to e-Medsys e-Prescribing are:

- maintaining detailed paperless records on prescriptions issued
- eliminating the paper needed for the prescription itself
- eliminating errors due to poor handwriting, and telephone time with pharmacists trying to decipher
- not having to speak with pharmacists regarding out-of-formulary medications
- never having to reissue a prescription because it was lost by the patient
- being able to immediately identify all patients based on medications prescribed

While e-Prescribing is a *built in feature* of our complete e-Medsys EHR, it can also be made available separately through our “a la Carte” format...ideal for practices that only require a certain element(s) of the full e-Medsys EHR now, with the ability to add others over time if needed.*

With e-Medsys EHR, Prescription Management and issuing prescriptions could not be easier.

Shred your prescription pads and get into e-Prescribing. You will not believe how you ever wrote a prescription once you have issued your first one electronically!
